HERDA TEST RESULT

ARCESE QUARTER HORSES, USA 1400 OLD GARNER RD WEATHERFORD, TX 76088	Case: HRD3181 Date Received: 19-Mar-2010 Report Date: 22-Mar-2010 Report ID: 1856-7532-8853-3033
Name: GUNNATRASHYA YOB: 06 Breed: QH Sex: S	Reg: 4912501 Alt. ID:
Sire: COLONELS SMOKING GUN Dam: NATRASHA	Reg: 4472679 Reg: 4655096

HERDA Test Result

N/N

Result Codes:

- N/N Normal - horse does not have the HERDA gene
N/HRD Carrier - horse carries one copy of the HERDA gene
HRD/HRD Affected - horse has two copies of the HERDA gene

Hereditary equine regional dermal asthenia (**HERDA**) is a degenerative skin disease characterized by hyperextensible skin, scarring, and severe lesions along the back of affected horses. Affected foals rarely show symptoms at birth. The condition typically occurs by the age of two, most notably when the horse is first being broke to saddle. HERDA is an autosomal recessive trait which means that breedings between carrier (N/HRD) horses have a 25% chance of producing an affected foal (HRD/HRD). Breedings between carrier and normal (N/N) horses produce normal foals, but 50% of these are expected to be carriers.

This test is specific for the mutation in the *cyclophilin B* gene (PPIB) that has been shown to be associated with HERDA. For more information go to <http://vgl.ucdavis.edu>.
